

Generating a Custom Inspector Script

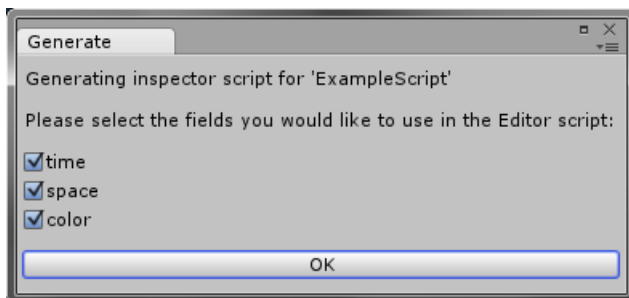

1. Select the script you would like to create the custom inspector for.

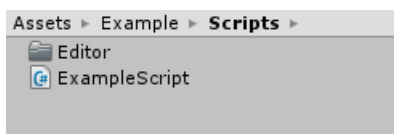

2. Click Edit -> Generate Custom Inspector or press Ctrl + I

3. Select the fields you would like to include in your Custom Inspector. Any public fields from the script you selected will be listed here.

4. The generated script will be placed in a folder called "Editor" next to the script you selected.

Editing the Template File

The generated Custom Inspector scripts are based on a template file, which is located at

"CustomInspector Generator/Template/CustomInspectorTemplate.txt".

You can edit the file to modify the output according to your needs.

The following XML-style tags will be processed by the script generation:

<ScriptName/>	Is replaced with the name of the original script
<EditorScriptName/>	Is replaced with the name of the editor script that is being generated
<ForEachField> ... <FieldName/> ... </ForEachField>	Works like a foreach loop to copy the code within the tags for each field that is selected to be included in the script. <FieldName/> will be replaced with the name of the field.
